The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in usual hybridisation and amplification assays for detecting infection. The present sequence represents a HEV-US2 full length gene sequence.
